

**Air University**  
(Mid-Term Examination: Spring 2024)

Subject: **Object Oriented Programming Lab**  
Course Code: **CS-214**  
Class: **BS- CYS- 2**  
Semester: **A**  
Section:

Total Marks: **30**  
Date:  
Time: **11:00 AM \_ 1:00 PM**  
Duration: **1 Hours**  
FM Name: **Mr. Mahaz Khan**

HoD Signatures: \_\_\_\_\_

FM Signatures: \_\_\_\_\_

**Note:**

- ☐ All questions must be attempted.
- ☐ This examination carries 15% weight towards the final grade.
- ☐ Submit source file of all 2 questions and also compile a complete report in MS Word.

	Q. No. 1 (CLO 3)	30 Marks
	<p>You are tasked with implementing a C++ program that demonstrates the concepts of <b>composition and aggregation</b> in object-oriented programming. The program should define classes for representing rooms, guests, and bookings.</p> <ul style="list-style-type: none"><li>The Booking and Guest classes should <b>showcase composition</b>.</li><li>The Room and Booking classes should <b>demonstrate aggregation</b>.</li></ul> <p><b>Tasks:</b></p> <p><b>Implement the Room class with the following specifications:</b></p> <ul style="list-style-type: none"><li><b>Private data members:</b><ul style="list-style-type: none"><li>roomNumber (integer).</li><li>roomType (string, e.g., "Deluxe", "Standard").</li><li>pricePerNight (floating-point number).</li></ul></li><li><b>Constructor:</b> Accepts parameters to initialize all attributes.</li><li><b>Accessor functions:</b> Separate get functions for each data member.</li><li><b>Overload the == operator</b> to compare two rooms based on roomType.</li></ul> <p><b>Define the Guest class with the following specifications:</b></p> <ul style="list-style-type: none"><li><b>Private data members:</b><ul style="list-style-type: none"><li>guestID (integer).</li><li>name (string).</li></ul></li></ul>	

	<ul style="list-style-type: none"> <li>○ contactNumber (string).</li> <li>• <b>Constructor:</b> Accepts parameters.</li> <li>• <b>Accessor function:</b> Get function for each data member.</li> </ul> <p><b>Create the Booking class with the following specifications:</b></p> <ul style="list-style-type: none"> <li>• <b>Private data members:</b> <ul style="list-style-type: none"> <li>○ <b>Composition:</b> A Guest object (each booking has a guest permanently associated with it).</li> <li>○ <b>Aggregation:</b> A Room object (a booking is linked to a room but does not own it).</li> <li>○ numberOfNights (integer).</li> </ul> </li> <li>• <b>Constructor:</b> Accepts parameters to initialize all attributes.</li> <li>• <b>Accessor function:</b> getTotalBill(), which calculates the total cost based on the room price.</li> <li>• <b>Overload the &lt;&lt; operator</b> to display booking details.</li> </ul> <p><b>In the main() function:</b></p> <ul style="list-style-type: none"> <li>• Create multiple rooms and guests.</li> <li>• Make room bookings for guests.</li> <li>• Compare two rooms using operator==.</li> <li>• Display booking details with operator&lt;&lt;.</li> </ul>	
	<p><b>Analyze the given C++ program and identify any logical, syntactical, or structural errors.</b></p> <pre>#include &lt;iostream&gt; using namespace std;  // Account class class Account { private:     int accountNumber;     float balance;  public:     // Default Constructor     {         accountNumber = 0;         balance = 0.0;     }      // Parameterized Constructor     Account(int accNum, float bal) {</pre>
